Cybersecurity content and compliance

SELECTED WORK | INFOGRAPHICS FOR PREY

1 **What's at Stake When Credentials Leak?**
Legal and financial risk of leaked credentials, with real breach cases and penalties.

2 **Credentials Are the New Perimeter**
Why the identity layer matters more than ever, and where teams lack visibility.

3 **Third-Party Breach? You're Still Responsible.**
How vendor and ecosystem exposure puts your credentials at risk beyond your own network.

4 **Is your company protected?**
Five baseline controls: MFA, updates, credential monitoring, staff training and strong policies.

What's at Stake When Credentials Leak?

Legal & Financial Risk Snapshot – 2024–2025

1- Real Cases, Real Penalties

Capital One

$190M
settlement after leaked credentials enabled access to 100M+ records

T-Mobile

$500M
settlement for breach exposing 76M users (2022)

Morgan Stanley

$60M
over improper handling of breached devices and account data

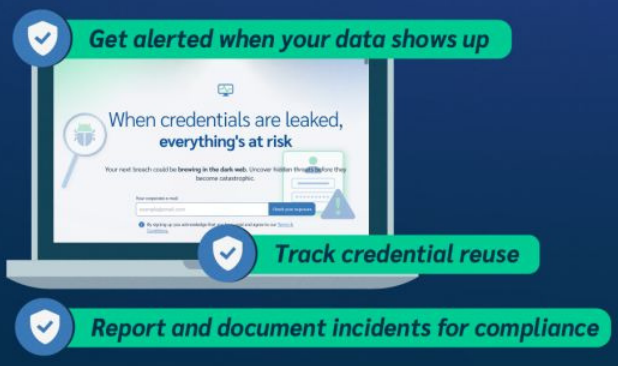

2- Legal Obligations and Consequences

- Regulatory Disclosure Deadlines
- Proof of Due Diligence in monitoring and mitigation
- Employee & Consumer Data Protection liabilities
- Fines + Civil Class Action Risks

3- Exposure Happens Fast

1- Credentials exposed on the dark web
2- No monitoring → breach goes undetected
3- Customer or employee files complaint
4- Regulator requests documentation
5- Company lacks visibility = legal firestorm

4- What You Can Do

Mitigate exposure

Monitor what's leaked before regulators do

Credentials Are the New Perimeter

Why the identity layer matters more than ever

1- The Security Perimeter Has Evolved

The rise of cloud, BYOD, and hybrid work has turned your users into your new edge

2- Attackers Don't Break In, They Log In

Credential theft enables stealthy, undetected entry.

Over 80% of breaches involve a human element many through compromised credentials

3- What Happens When Credentials Leak

1- Compromised login hits dark web dump
Often within hours of breach

2- Credential reused in other platforms
Attackers try across your stack

3- Access granted to shared apps or cloud tools
Few companies monitor low-privilege access

4- Persistence via token or MFA fatigue
Stolen identity becomes long-term access vector

4- Where Most Teams Lack Visibility

- ✅ *Known corporate email domains → Monitored*
- ❌ *Subdomains and staging envs → Ignored*
- ❌ *Contractor and ex-employee accounts → Rarely tracked*
- ❌ *SaaS login leaks on dark web → Undetected until damage is done*

5- Identity-First Security Starts Here

- ✅ *Audit shadow credentials and inactive accounts*
- ✅ *Use a dark web monitoring tool to flag leaks*
- ✅ *Prioritize credential freshness over complexity*
- ✅ *Monitor third-party account exposure*
- ✅ *Align credential policies with compliance goals (e.g., SOC 2, HIPAA)*

If credentials are your new perimeter... shouldn't you know when they're exposed?

Learn how Prey's Breach Monitoring helps surface exposed accounts fast — so you can take action.

Third-Party Breach? You're Still Responsible.

1- Ecosystem Exposure

Your credentials travel far beyond your own tools

2- Real Risks

Former vendors still active in SSO.
Shared login credentials across companies.

3- Case Study Box

Third-party breaches
that leaked client credentials.

4- Solution

Breach Monitoring tracks exposure, even from outside your org.

Breach monitoring doesn't stop at your network
it follows your credentials.

Is your company protected?

1

Implement Multi-Factor Authentication (MFA)

Require MFA for all business accounts, including emails and cloud services

2

Keep Software Updated & Patch Vulnerabilities

Enable automatic updates for all business applications and systems

3

Monitor the Dark Web or Leaked Credentials

Get real-time alerts if your business credentials are compromised

4

Train Employees on Cybersecurity Best Practices

Conduct regular phishing simulation tests to train staff to recognize scams

5

Enforce Strong Passwords & Policies

Set up automatic password rotation policies to prevent old credentials from being exploited.
